

Improving Immunization through Increased Community Ownership: My Village, My Home

Lora Shimp,

Director, JSI
Immunization Center

21 October 2021

My Village My Home
(To be filled up at each Routine Immunization session site)

Year: 1st April to 31st March

ASHA

Year: 1st April to 31st March

Population covered: Annual Target:

Child Name	Mother's name	D.O.B.	Birth Weight	At Birth		At 6 weeks		At 10 weeks		At 14 weeks		Between 9 to 12 months		Between 18 to 24 months	
				B.C.G.	D.P.V. '1'	Hepatitis B Birth Dose	D.P.V. '1'	Pentavalent '1'	D.P.V. '2'	Pentavalent '2'	D.P.V. '3'	Pentavalent '3'	Measles '1'	J.E. '1'	Vitamin A

Fill the information of beneficiaries from bottom to top according to date of birth.

Guidelines for using 'My Village My Home': Every year in 'My Village My Home' tool in a AWC - 1. Fill the details of all the children born between 01st April of current year to 31st March of next year in Column 1 (from bottom to top). 2. Details of children who migrated from another place to this AWC and will specially reside in this village now will have to be incorporated in this tool. 3. The date on which a vaccine is given, has to be written in the space specified for that vaccine only. 4. The tools in which birth calls are observed, home visits to the beneficiaries have to be undertaken with the beneficiaries motivated to complete the remaining doses. It is the responsibility of the field-level worker and ASHA to ensure the immunization of all the left-outs and drop-outs. 5. Program is start every year and to according to the guideline. Keep the tool year's chart safely for comparison purposes.

* In the districts where JE vaccine is included in the immunization schedule.

Please key messages to be given to the beneficiaries: 1. What vaccine was given and what disease it prevents. 2. When to come next and for which vaccine. 3. What minor adverse events could occur and how to deal with them. 4. To keep immunization card safe and to bring it along for the next visit.

FIELD ACTION REPORT

Engaging Communities With a Simple Tool to Help Increase Immunization Coverage

Manish Jain,^a Gunjan Taneja,^b Ruhul Amin,^c Robert Steinglass,^d Michael Favin^e

Use of a simple, publicly placed tool that monitors vaccination coverage in a community has potential to broaden program coverage by keeping both the community and the health system informed about every infant's vaccination status.

CONCLUSION

"My Village Is My Home" is a promising tool that can strengthen community participation in immunization. It has the potential to increase demand for immunization within health services and among the public, increase identification of young children requiring immunization, improve timeliness of vaccination, and boost coverage. Further trials and evaluation of its ability to improve vaccination coverage as well as community participation are merited.

MyVillage My Home Tool and Home-Based Records

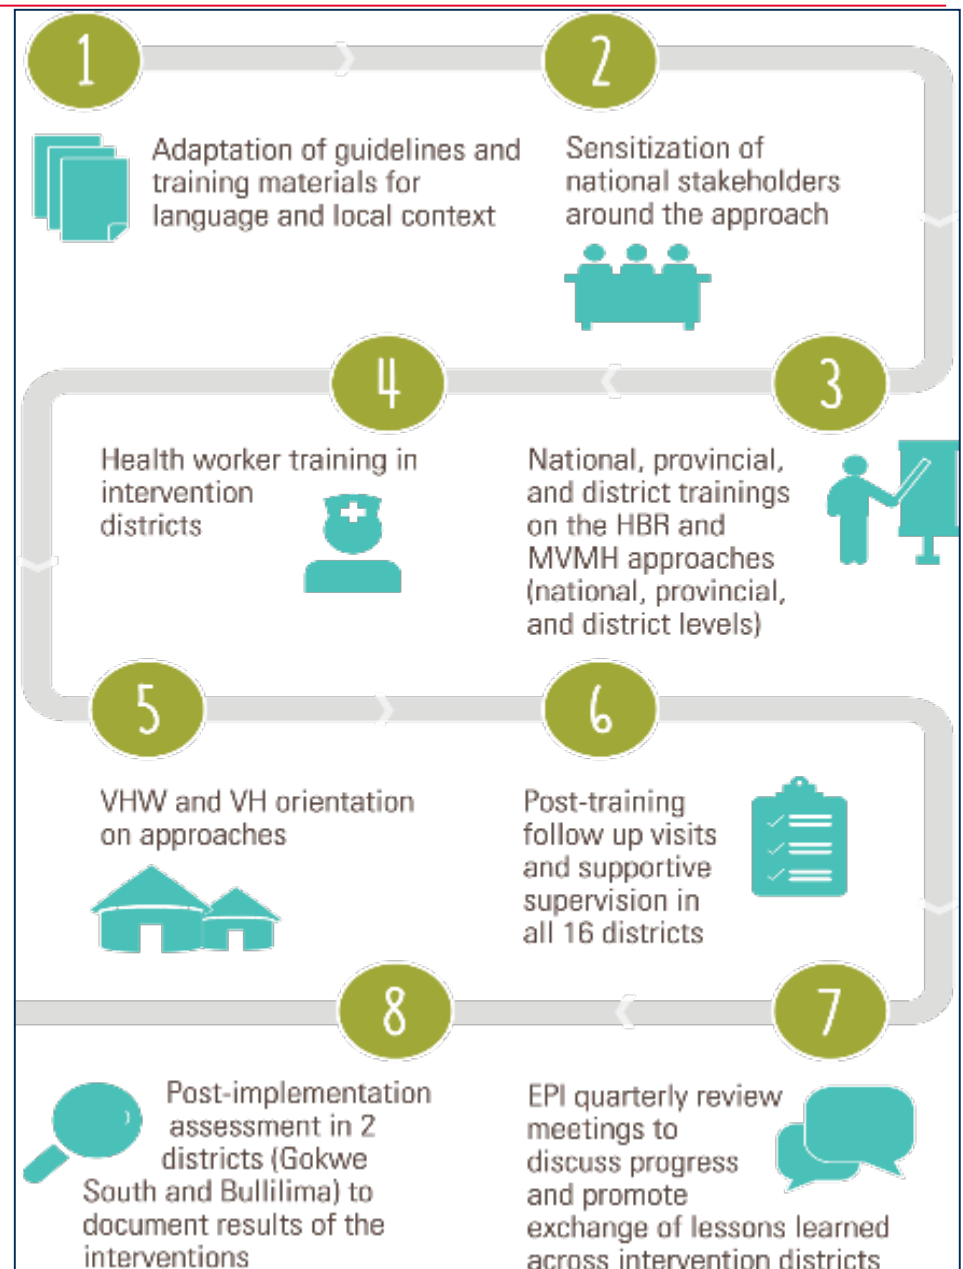

How does it work?

RI improvement: MVMH Approach

Note: In **every** country, MVMH has been part of several linked tools and approaches for:

- Newborn vaccination,
- CHW and community engagement,
- Addressing under-vaccinated/drop-outs
- Use of HBRs/cards and registers
- Process monitoring
- Service delivery and RED/REC quality improvement and equity

Zimbabwe example

- In 2017, JSI supported two districts in Manicaland province—Makoni and Chipinge—for MVMH and HBR interventions (with Village Heads and VHWs)
- In 2018, JSI supported rollout of MVMH and HBR strategies to 16 districts with low Penta3 <80% vaccination coverage (proxy indicator).

Position	# of People Trained
EPI Manager	1
Senior National Officer	4
Provincial Nursing Officer	8
EPI Officer	8
District Nursing Officer	16
Community Health Nurse	16
Rural Health Centre Nurse	510
Village health worker	2,185
Village Head	2,185
Total trained in the two approaches	4,933

Evaluation Methodology

Questionnaire	Who was interviewed	Number of interviewees
Caregiver Exit Interview questionnaire	Caregivers who had visited the health facility	45
Health Worker Interview	Nurse found on duty at health facility	10
Village health worker Interview	Village health worker who was oriented on MVMH HBR	17
Village Head Interview	Village Head who was oriented on MVMH HBR	18
EPI Manager In-depth interview	National EPI Manager	1
Provincial Nursing Officer In-depth interview	Provincial Nursing Officers from Mat South and Midlands	2
District Nursing Officer In-depth interview	District Nursing Officers from Bulilima and Gokwe South	2
Total Number of people Interviewed	95	

- **Location:** Matabeleland South and Midlands provinces in 2 randomly selected districts: Bulilima and Gokwe South
- **Timeline:**
4-10 November 2019
- **Approach:**
 - 10 randomly selected rural health centres (5 per district)
 - Exit interviews with caregivers
 - In-depth interviews conducted with staff from the selected facilities, VHWs, and VHS
 - Evaluators examined completeness and use of the VHW register

Summary of Findings

The village health worker with the ZEPi register and Village Head with MVMH tool

Caregiver Knowledge : CHC Importance, Vaccines and Due Dates

(n=45)

*Improved understanding of
card, but more HW
communication needed on due
dates and vaccines received*

VHW responsibilities

- 14/17 (82%) of VHWs interviewed reported that they are now able to reach more children through use of the MVMH tool
- 17/17 (100%) of VHWs are conducting defaulter tracking, updating VHW ZEPI register, and have knowledge of CH card
- 5/17 (29%) VHWs reported missing bricks on the MVMH tool since implementation started -

verification with Village Heads noted caregivers by name with defaulter reasons as: caregiver travel, lack of knowledge, religious beliefs

DTP I Coverage Jan - Sep 2018 & 2019 in Project Districts

■ 2018 ■ 2019

Note: As these are percentages, it is useful to **compare with trends in #s vaccinated over a 3-4 year period**, particularly where there are known denominator issues

DTP1 to MRI drop out rate 2018 & 2019 in project districts

■ 2018 ■ 2019

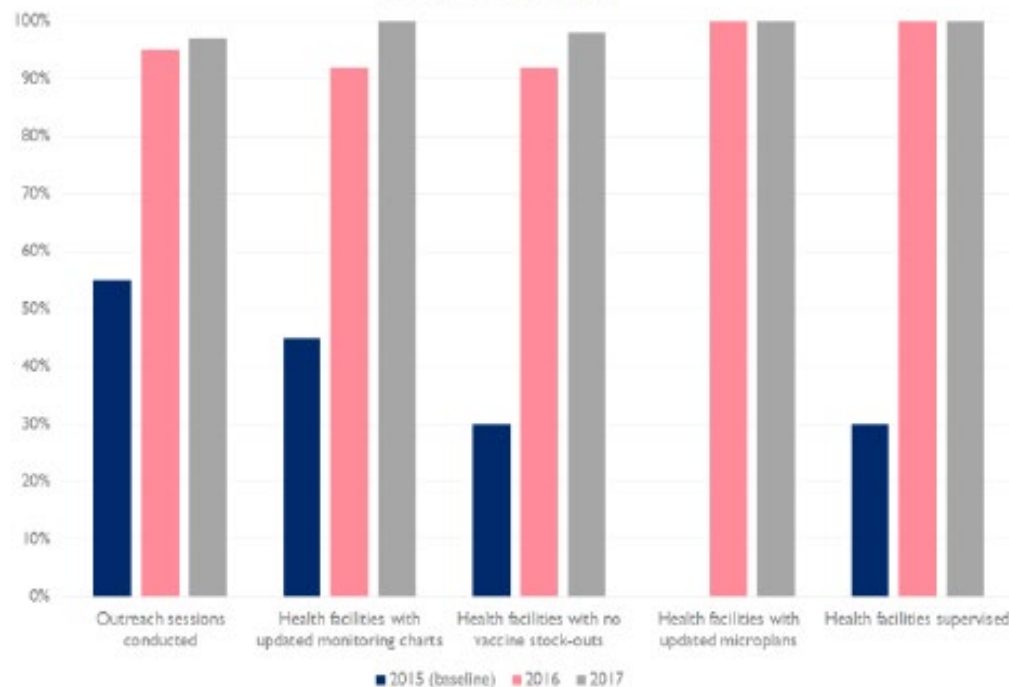

Issues: Uncertain denominator; Measles vaccination after 11 months and/or infants being turned away if insufficient # to open vials?; Specific issues with birth recording and infants reached in first months of life – e.g. UMP, Chiredzi?

Malawi

From 2015 to 2017, immunization process indicators in the two districts improved in several areas as the chart below displays.

For further information, contact Asnakew Tsega (asnakew_tsega@jsi.com).

MCSP supported the Ministry of Health to significantly improve process indicators since 2015

Currently: 3 districts implementing;
expanding to 10 districts with HSS and PEF funding

Community members use My Village My Home
[Source: Asnakew Tsega/MCSP]

[MyVillage My Home: Strengthening Routine Immunization in Malawi - YouTube](#)

Lessons Learned

- Implementation needed on a larger scale to fully measure impact and ensure sustainability
 - part of microplanning and resourced community initiatives long-term
- Multi-faceted approach that includes other monitoring tools (registers, HBRs), process monitoring, and supervision
- MVMH empowers community leaders and facilitates sense of shared responsibility and collective accountability
- Continuous follow-up needed with the village heads to sustain motivation to improve demand for immunization services
- Involvement of other ministries adds value and ownership to register newborns, address 'denominator issues,' and reduce vaccine preventable diseases

Zimbabwe learning: Challenges

- Timeframe of the project implementation period was short which made assessing full impact on the immunization program difficult
- Due to funding limitations, implementation was in a very small geographic area
- Data quality presented an issue where data on the T5 summary sheets don't match the HMIS data for the same health facility

Improvement in Defaulter Tracking: Village Heads and Caregivers

“I don’t want my village to be destroyed by a cyclone of preventable diseases. I will make sure all bricks for each child are in place.”

- 67% of VHs reported that one of their roles is keeping the MVMH tool up to date with no missing bricks
- 94% of VHs understand that their role is to work in collaboration with the VHW to follow-up with immunization defaulters
- 96% of the caregivers who knew about the tool had their child registered on it

Reflections

The link between the health facility, the VHW and Village Head is clearly demonstrated when using the MVMH tool and results in collective accountability for ensuring children are protected from vaccine preventable diseases.

-District Nursing Officer

We are now fishing out those who refuse to have their children vaccinated through using the chart (MVMH tool).

-Village Head

Using the MVMH tool I am now able to assess vaccination status of children in my village at a glance. The Village Head is very keen to make sure children in his community are vaccinated so that the tool has no holes at all.

-Village health worker

Community Monitoring of Individual Children's Vaccinations: **SIX COUNTRY EXPERIENCES**

December 2018

www.mcsprogram.org

	Timor-Leste	India	Malawi	Zimbabwe	Nigeria	Tanzania
When began	2011–2013	2012–2014	2016–2018	2017–2018	2016–ongoing	2017–ongoing
How updated	From home-based records and recall during home visits and monthly village health days; hamlet MVMH tools were compared with the EPI register during monthly meetings at the village council office	ANMs and AWWs updated the MVMH tool at the end of each VHND	VHs and volunteers updated MVMH tools during home visits and outreach sessions	VHWs first updated their registers (for all children under two) by comparing them with the HF registers; then they checked child health cards and updated the tool monthly	Traditional leaders update the name-based records in house-to-house visits, and meet with the local HF monthly to reconcile the community and HF registers; volunteers update MVMH weekly	CHWs enroll newborns and also visit HFs to compare the MVMH tool with facility register and identify defaulters (no census)

Results (as of Dec 2018)

summarized by:

- coverage
- timeliness
- target population
- feeling shared responsibility
- accountability
- integration

POPING IN THEIR HOMES						
Results: Coverage	Number of infants vaccinated increased substantially; coverage likely improved but poor data quality and faulty population estimates did not allow proof	Jharkhand communities using MVPS-I had 80% or higher coverage for all vaccines, with only 1.5% of children having no vaccinations; overall district coverage in same time period was much lower at 49% to 69%; in UP coverage rates increased for all vaccines except measles, and the rate of unimmunized children decreased from 12.6% to 4.7%	Surveys show almost 100% coverage and less than 2% of children from 12–24 months with no vaccinations	Too soon to systematically assess impact on coverage; nurses note improved documentation of return dates on cards and EPI registers; MVPS-I has resulted in VIs becoming active in visiting families of children behind for vaccinations	Independent baseline survey recently repeated but findings unavailable for this paper; stakeholders interviewed in a mid-project review strongly believed that coverage had increased	Too soon to assess
Results: Timeliness	Analysis of one MVPS-I village's data showed improvements in timeliness of most doses	Analysis showed clear, positive impact on vaccination timeliness	Baseline and endline surveys show improvement in timeliness	No specific data but most HF staff note improved documentation of return dates on cards and in the EPI registers	Likely that timeliness has improved, but specific evidence is not yet available	Too soon to assess

	Time-Lapse	India	Malawi	Zimbabwe	Nigeria	Tanzania
When began	2011-2013	2012-2014	2016-2018	2017-2018	2016-ongoing	2017-ongoing
Results: Target population	Community members found many infants missed by the health system; in village analyzed, number of infants identified and immunized rose substantially with use of MVPS-I compared with the previous year	MVPS-I enabled service providers to view the entire cohort together; district data showed that the intervention of AWCs/VINCO improved coverage compared to their districts as a whole	Left-outs were registered and mobilized (e.g., a family of three children never vaccinated was identified through the micro-census)	In a rapid assessment, many nurses said that they now had more reliable and complete registration of children under two; this helped them to better estimate vaccine requirements and immunization coverage, and to work with communities to track individual children	Due to the various initiatives, including use of community registers, it is likely that HFs have a more complete listing of infants in their catchment areas	Left-outs are registered and mobilized; if CHWs find a child with no vaccinations, they register the child and send the information to the HF to be included in the HF register
Results: Feelings of shared responsibility	Monitoring and evaluation studies found good acceptance	Service providers perceived stronger community engagement; MVPS-I assessors in Jharkhand continued using the tool at least two to three years after project support ended	VIs, volunteers, and community members felt responsible for ensuring their children were vaccinated and proud of their community's coverage	Indirect evidence: EPI became more of a regular agenda item at health center meetings and in meetings between the HF and VIs/VWs; also, health workers met with VIs and VIs/VWs more regularly than before MVPS-I	A predominant theme from interviews in the mid-project review was that barriers, VIs, and TBAs are now being seen and treated as extensions of the HFs	Too soon to assess; CHWs, together with the HF governing committee, has resulted in more support for immunization from community members
Results: Accountability	Volunteers and leaders began complaining if outreach postponed, due to their involvement in micro-planning and MVPS-I	The additional community engagement supported the Universal Immunization Program	Informants say that VIs have become much more vocal in reporting problems with health services	VIs now more insistent that HFs ensure adequate supply of vaccine and cards, so coverage does not suffer	Enhanced sense of community ownership of routine immunization	VIs have become more vocal in reporting problems with health services
Results: Integration	An NGO project adopted the MVPS-I tool for community monitoring of	VINCO are already integrated; not only are vaccinations given but growth monitoring	Exclusive breastfeeding and family planning are not tracked but are	Tool includes tracking of vitamin A doses; has been complementary to community	A memorandum of understanding among the state government, BMGF, and	MVPS-I includes monthly growth monitoring for nutritional status as well

Recommendations

Building Routine
Immunization Capacity,
Knowledge and Skills
(BRICKS) - JSI

BRICKS

Building Routine Immunization
Capacity, Knowledge & Skills

EPI CORE COMPETENCIES

- Job descriptions (requirements and skills, including pre-service)
- Job performance measurement and expectations
- Quality improvement
- Team roles and responsibilities

SITUATION ASSESSMENT

(identify needs, prioritize, and ensure support)

- Organized around RED components
- Incorporates equity and REC-QI to sustainably serve un/under-vaccinated
- Root cause analysis in the field
- Internal (and external) field assessment, with correction of gaps on site

SUPPORTIVE SUPERVISION

- Qualified supervisors
- Track recommendation between visits
- Facilitated performance improvement
- Key immunization indicators (particularly if integrated supervision)

REVIEW MEETINGS

- Monthly/quarterly data review and dialogue (based on trend analysis)
- Peer-learning and exchange
- Small, do-able actions for systems and program improvements

APPLIED TRAINING (on job and coaching)

- Qualified coaches/mentors
- Skills in locally-generated data triangulation and use
- Self-learning, self-assessment, and competency-based
- Need-based, practical training (on-job, classroom and hands-on)

Recommendations

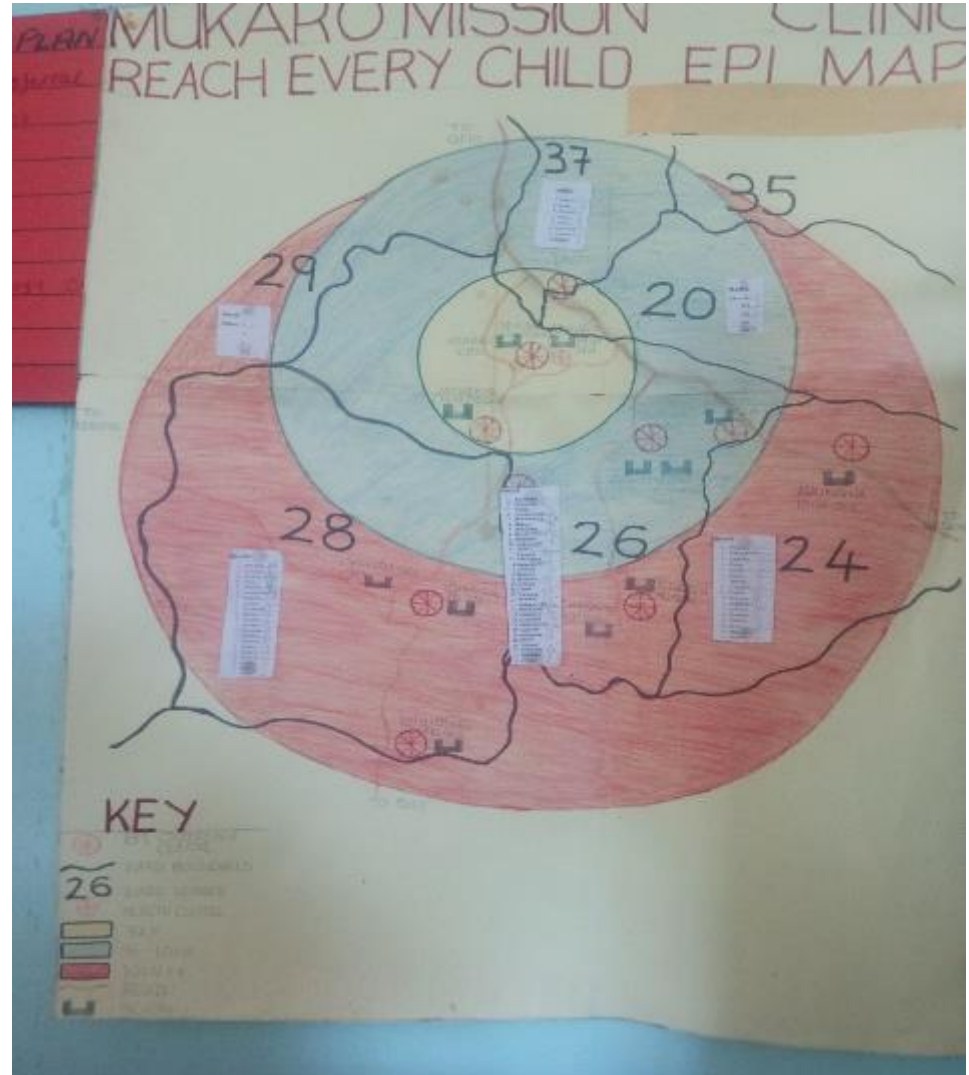

- Include follow-up on the MVMH/HBR implementation as an agenda item in supportive supervision visits, conducted by DNOs.
- National EPI program to provide defaulter tracking registers/standard tools for the health facility and village health workers.
- Link the MVMH/HBR approaches with other community-based efforts, like the community health dialogue between health workers and community members, to ensure sustainability.
- Engage the health promotion unit at all levels during planning and implementation as the MVMH/HBR interventions are demand related.
- Data triangulation to ensure data quality can be carried out during follow-up visits through comparison of the MVMH/HBR tools with the government data collection forms (i.e., T6 form, T5 consolidation form, and immunization monitoring graph).

Noted Improvements During Implementation

Testimonials from the Malawi MVMH video

Malawi local immunization officer

A portrait of James Ntonga, a man with short dark hair, wearing a red shirt. He is looking slightly to the right of the camera.

James Ntonga

Environmental Health Officer - Ntchisi

Every group village head identifies the infants who are supposed to receive vaccines.

They submit names of volunteers who can read and write, since the immunization and infant tracking work demands those attributes.

A large blue arrow pointing from the text above to the text below.

Resulting in training and engagement of:

Village Leader

Kapoloza

Group Village Headman

We discussed that every newborn is supposed to be vaccinated according to schedule.

That will contribute to the reduction of infants mortality rate .

Community volunteer

Yohane Gidion

Volunteer - T/A Nkukula - Dowa

We were trained to register every newborn baby on the chart.

The chart contain records of vaccine recieved by every child registered. In case the infant defaults, we follow up with them in their homes.

Caregiver and community volunteer

Ebinala Natani

Beneficiary - Chibisa Village - Ntchisi

I began to utilize immunization services after being encouraged by a volunteer who visited my house.

Health Center Administrator

Mavuto Guma

HSA - Nkhuzi Health Centre - Ntchisi

We conduct meetings in every village under group village headman level to sensetise the community about infant tracking and immunization.

This has really improved awareness and has increased the number of infants being immunized.
