FROM THE AMERICAN PEOPLE

THE USAID LAOS MATERNAL CHILD HEALTH AND NUTRITION PROGRAM

2022-2026 | IMPLEMENTER: JSI | BUDGET \$35,000,000

The USAID Laos Maternal Child Health and Nutrition Program (LMCHN) supports communities across five provinces to provide accessible and high-quality health and nutrition services to children, adolescents, and women.

Despite having made significant progress in improving maternal and child health outcomes, the Lao People's Democratic Republic (Lao PDR) has the highest neonatal and under-five mortality rates in the Association of Southeast Asian Nations, with neonatal mortality at just above 21 per 1,000 live births,¹ and under-five mortality at 42.5 per 1,000 live births.² Laos has one of the highest adolescent birth rates in the region and maternal mortality (at 126 per 100,000 live births¹) is also high, and particularly so among poor, remotely located women belonging to ethnic minorities who have limited access to education.

THE LMCHN APPROACH

The LMCHN Program is working with over 230 health centers and district hospitals, 650 health workers, and over 1,500 village health communities to strengthen support for maternal and child health and nutrition services.

The goal of the LMCHN Program is to increase access to quality maternal and child health and nutrition services and to ensure communities supported by this project are empowered to be change agents in improving health outcomes for women and children.

ANTICIPATED OUTCOMES OF THE PROGRAM

To achieve its vision, the Program is aligned with the Lao PDR's Sam Sang Directive, which delegates increasing responsibility to local administrations. In support of the Ministry of Health's Reproductive, Maternal, Newborn, and Child Health Strategy and Action Plan (2016–2025), the program will strengthen capacity of national, provincial, and district health partners and engage communities to work with the health system to achieve better health outcomes by:

- Increasing access to, and use of, MCHN services.
- Improving the quality of MCHN services.
- Strengthening health system capacity at all levels.
- Promoting the adoption of optimal MCHN behaviors by families and communities.

FURTHERING AN UNDERSTANDING OF MNCH BEHAVIORS IN SUPPORTED SETTINGS

The program includes a research, monitoring and evaluation arm, which will conduct studies to both guide the direction of the LMCHN Program and further collective understanding of health behavior needs in supported contexts. The Program implemented the baseline assessment, which included a knowledge attitudes and behaviors household survey and a series of focus group discussions related to maternal, child, and adolescent health.

The LMCHN Program is also implementing a gender equality and social inclusion analysis, and a baseline health facility assessment is planned. In addition, the Program is currently implementing cognitive testing for a pediatric experience of care scale in collaboration with MOMENTUM Knowledge Accelerator. The lack of standardized and validated tools for measuring experience of care represents a barrier for identifying programmatic needs and measuring implementation progress. This research will gather information about how the items in the scale are interpreted and understood by caregivers and will inform the refinement of the scale and its use in the program.
